Arc2HTML. Arc Directory html pages and Cisco IP phone IDLE URL Service for Arc v1.0(8)

Description: This software periodically creates html pages from Arc SQL database. These pages serve as Cisco IP phone Idle URL service (ext.asp), that will display Arc Presence Status along with corporate messages as an idle url screen. Html pages also provide online phone directory pages for end users. Displayed information includes current Arc Presence status. These directories pages do not require end user authentication. While the application is scanning the Arc database for Arc Presence status information, it resets expired Presence Status entries to 'Available'.

Requirement: Arc Enterprise 5.0/5.1 server with Arc Web/XML Presence server. This program will be delivered with a detailed installation and configuration guide. This program works on both "Win Server 2003 + MS SQL 2005 SP2" and "Win Server 2008 + MS SQL 2008 SP1" platforms.

Applications: This service offers an easy way for Cisco Phone users to remember their Arc Presence status and receive general corporate messages to ip phone screens. Directory html pages provide a quick and easy to use online corporate phonebook with Arc Presence status information. With Cisco Click-to-Dial widget, it is easy to configure click-to-dial functionality to end users.
